

Abstract of the Disclosure

A communication-associated structure and process utilizing (a) a client device, (b) a communication port, and (c) an imaging device which includes an embedded driver and related configuring information. The process, employing these structural elements, involves communicatively associating the two devices through the communication port, and thereafter, and making use of the embedded driver and related configuring information, equipping the client device with a fully configured installation of that driver. This equipping is accomplished through the specific steps of downloading, from the imaging device to the client device, the embedded driver and related configuring information, and thereafter auto-configuring the downloaded driver with the downloaded configuring information.
